

Dismantling

Dismantling furniture is associated with risks. Particular care must be taken when dismantling electrical and water-bearing components and when loosening wall fixings or dismantling wall-mounted units.

In principle, non-destructive dismantling and reuse of the furniture is possible, as it generally consists of elements that are detachably connected to each other.

However, there are some exceptions where the elements are glued together and therefore cannot be removed without destroying them. Examples of this are:

- (corner) joints of worktops
- backsplashes
- flush-mounted installation of hobs and sinks

Non-destructive disassembly must be checked on a case-by-case basis, as this depends on the type and quantity of adhesive used.

The notes in the assembly instructions can help with disassembly. These must then be carried out in reverse order. Observe the safety instructions given in the installation instructions; these also apply to disassembly. The manufacturer cannot accept any liability for damage caused by dismantling!

At the end of use, the individual elements can be dismantled further and materials can be separated by type as far as possible. The materials can then be recycled in suitable recycling streams.

Disposal / Recycling

For recycling, the individual materials should be separated as far as possible and fed into suitable recycling streams.

The furniture consists of various elements that can largely be broken down into components with homogeneous materials. For this purpose, screw or plug connections must be loosened.

Separable materials are e.g. wood/wood-based materials, plastics, metals, glass, ceramics and composite materials.

Electrical components cannot be further dismantled and must be handed in to a dealer or disposal centre. Electrical components are labelled with the following disposal symbol.
